Not illustrated. 1919 Excerpt: . scientists will no doubt ultimately arrive at the correct hypothesis for solving the problem of why one combination of electrode material and work material is productive of better results than can be obtained with another combination, the writer s conclusion is that, with the data at present available, the determinations must be made by actual experimenting--having in mind the qualities desired in the particular weld, such as ductility, tensile strength, elongation, and elastic limit. Inasmuch as it is possible, with the automatic machine, to main Fig. 7.--Tungsten High-speed Ring Automatically Welded By MetallioElectrode Arc Process To Cold-rolled Core To Form Milling-cutter Blank. tain arc uniformity with practically any kind of electrode material and to produce welds which, under low magnification, at least, appear to be perfect, and which respond favorably to ordinary tests such as bending, cutting and filing, it is reasonable to conclude that proper selection of electrode material will be productive of perfect welds on any kind of work material. To date, no steel has been tested on which apparently satisfactory welds could not be made. High-speed tungsten steel has been successfully welded to cold-rolled shafting, using Bessemer wire as electrode material, as is shown in Fig. 7. Ordinary steels varying in carbon content from perhaps 0.10 to 0.55 per cent. have been welded with entire success. Condition of Metal in Crater.--Because of the fact that the complete welding operation has been automatic and may be continued for a considerable length of time,...
